

AUTO\MATE

YOUR COZY DEVELOPER COMPANION FOR POST-RELEASE MAINTENANCE, FEEDBACK, AND FIXES.

The Brand Image Problem

“WHEN A FEATURE OR PRODUCT BREAKS POST-RELEASE, THE TRUE COST ISN'T JUST DEVELOPER TIME , IT'S BRAND EQUITY, USER CHURN,
AND STORE RATINGS CRASHING IN REAL TIME “

The 4 key pain points

01. THE BLACK HOLE

No smarter intermediary system to curate issues and help with priortisation

02. MOMENT OF FAILURE

Recreate the exact conditions behind a reported failure, eliminating hours of manual reproduction and investigation.

03. RCA

The agent traces the issue through the codebase, execution flow, logs, and recent changes to identify what actually caused the failure.

04. QUICK FIX

Implement the fix, run tests to validate it, and raise a pull request for the developer to review and approve.

MULTI CHANNEL INSIGHTS

Model Agnostic

Persistent Memory

Autonomous Agent Reasoning

Codebase Understanding

Sandboxed Execution

Autonomous Code Editing

Context Management

Sandboxed Execution

GitHub / Git Workflows

WE GOT A TON OF FEATURES

MCP Integration

Docker / Kubernetes Support

Parallel Tool Execution

Computer / Terminal Interaction

Slack / Jira / Linear Integrations

Skills

Cloud Deployment

Browser Interaction

Security & Action Validation

Custom Tools

Specialized Sub-Agents

Developers don't spend hours curating & recreating bugs, Deciding prioritisation of feature shipping instead they receive a tested, ready to review production solution

Thank you!
